

CoolDesk

AC Service Management Portal

Product Feature Proposal

Prepared for: AC Installation & Services Business

Document version: 1.0 | Modules: 17 (16 core + 1 optional) | User roles: 3

This document outlines the complete feature set for CoolDesk, an internal operations portal designed to help your AC service business manage installations, track customer complaints, assign and monitor technicians, collect payments, segregate data by brand, and view business analytics — all in one place.

1. Platform overview

CoolDesk is a three-role web portal that replaces manual tracking via WhatsApp, paper, or spreadsheets. It covers your two core service types — AC installations and complaint resolutions — and gives every person in your business a focused interface built for exactly what they need to do.

1.1 The two pillars of the platform

Installations and complaints are the twin core of CoolDesk. Both are tracked end-to-end with their own status flows, technician assignments, payment records, and brand labels.

Figure 1 — The two primary job types that anchor the platform

1.2 The problem it solves

- Installation jobs are booked verbally and never formally tracked or assigned
- Complaints logged by phone get lost before they are acted on
- No visibility into which technician is handling which job
- Revisits are unstructured — no record of scheduling or whether the technician showed up
- Payment collection goes untracked until someone chases it
- No brand-level view — impossible to see how many Haier vs Dawlance jobs were done
- Owner has no way to measure technician performance without asking around

1.3 The three user roles

Each role sees only the interface built for their job. The owner has access to everything.

Figure 2 — The three user roles and their responsibilities

2. Job lifecycles

CoolDesk tracks two types of jobs — installations and complaints — each with its own status flow. When a complaint visit fails to resolve the issue, it branches into the revisit track.

2.1 Installation status flow

Every installation job moves through a clean six-stage track from booking to completion.

Figure 3 — AC installation job status flow

2.2 Complaint status flow

Every complaint follows the same primary track, from logging to resolution.

Figure 4 — Complaint primary status flow

2.3 Revisit track — triggered from 'Needs Revisit'

When a technician cannot resolve a complaint on the first visit, the complaint branches into the revisit track. Each revisit is its own record with a scheduled time, recorded arrival, and outcome.

Figure 5 — Revisit lifecycle (loops back if unresolved again)

A complaint can only be fully closed when a technician explicitly marks it as resolved — whether on the first visit or a revisit. No complaint can be dropped mid-cycle.

2.4 Mandatory revisit reasons

Before marking 'Needs Revisit', the technician must select or enter a reason. This data becomes searchable and feeds into analytics.

Figure 6 — Revisit reasons the technician must provide

2.5 Visit attendance outcomes

Every scheduled visit — first or revisit — has a scheduled time and a recorded arrival. The system calculates the outcome automatically.

Figure 7 — Visit attendance outcome labels

2.6 Full status reference

Installation statuses:

Label	Status	Meaning
S	Scheduled	Installation job booked and logged. Date and time set.
A	Assigned	Technician assigned. In-app notification sent.
P	Acknowledged	Technician confirmed receipt of the assignment.
T	In transit	Technician is on the way to the installation site.
W	In process	Technician is on site and performing the installation.
C	Completed	Installation done. Payment status recorded.

Complaint statuses:

Label	Status	Meaning
N	New	Complaint logged. Awaiting technician assignment.
A	Assigned	Technician selected. Notification sent.
P	Acknowledged	Technician confirmed receipt.
T	In transit	Technician is on the way.
W	In process	Technician is on site, working.
R	Resolved	Issue fixed. Complaint closed.

V	Needs revisit	Issue unresolved. Reason logged. Revisit created.
S	Revisit scheduled	Return visit date and time set.
RV	Resolved on revisit	Issue fixed on return visit. Complaint closed.

Visit attendance outcomes:

Label	Status	Meaning
	On time	Technician arrived within the grace period (default: 15 min).
	Late	Technician arrived after grace period. Delay recorded.
	No-show	No arrival recorded. Flagged on owner dashboard.
	Rescheduled	Visit moved before it occurred. New slot assigned.

3. Feature modules

CoolDesk is organised into 17 feature modules across five categories. Module 16 (customer reviews) is an optional add-on and is clearly marked throughout.

Figure 8 — All 17 modules at a glance

Category A — Core operations (Modules 01 – 06)

01 AC installation tracking **Core**

The primary module for managing every AC installation job from booking to completion. Installations are a first-class job type alongside complaints.

- Log a new installation job with: customer name, phone, address, AC brand, model, unit type (split, cassette, inverter, window), and number of units
- Set scheduled installation date and time at the point of logging
- Assign technician from roster — technician receives an in-app notification
- Technician acknowledges, marks In Transit, In Process, and Completed as the job progresses
- Technician logs actual arrival time at site — punctuality tracked automatically
- Payment recorded on completion: amount, method, and collected vs pending
- Installation record is tagged with brand — feeds into brand segregation analytics
- Owner and office can view all open and completed installations in a filterable list
- Installations appear on the owner dashboard alongside complaints for a unified job view

02 Complaint management **Core**

The central hub for logging and tracking every customer complaint from intake to final closure.

- Create a new complaint with: customer name, phone, address, AC brand, model, and issue description
- Auto-generated complaint ID and timestamp on every entry
- Attach notes and follow-up comments at any stage of the complaint
- Search and filter by date, status, technician, customer name, brand, or payment status
- Full timeline view inside each complaint — every status change, note, and revisit record in order
- Complaint record tagged with brand — feeds into brand segregation analytics
- Repeat complaint badge shown automatically when a returning customer hits the alert threshold

03 Technician assignment **Core**

Office staff and the owner can assign any job — installation or complaint — to an available technician.

- Dropdown of all active technicians when logging or editing any job
- Workload indicator showing each technician's current open job count before assigning
- Reassign jobs to a different technician at any point
- Assignment history logged — full record of who handled what and when
- Owner can assign, reassign, and override assignments at any time
- Technician can be assigned different job types simultaneously (e.g. both installs and complaints)

04 Notifications and acknowledgment Core

Technicians are immediately informed of new assignments — for both installations and complaints — and must confirm receipt.

- In-app notification sent the moment any job is assigned (installation or complaint)
- Technician sees full job details: customer address, job type, brand, and office notes
- One-tap Acknowledge button to confirm receipt
- Unacknowledged jobs are flagged on the owner's dashboard
- Acknowledgment timestamp recorded automatically for reporting
- Separate notifications sent for revisit assignments

05 Live status updates from the field Core

Technicians update job status from their phone as they progress — for both installations and complaints.

- Status update controls follow the relevant track: installation or complaint
- Technician logs actual arrival time at site — system compares to scheduled time automatically
- Option to add a field note at each status change
- All status changes are timestamped and visible to office and owner in real time
- For complaints: technician must provide a mandatory written reason before marking 'Needs Revisit'
- For installations: technician marks completion and records payment in the same final step

06 Payment tracking Core

Every job — installation or complaint — has a payment record so the owner always knows what has been collected and what is outstanding.

- Technician marks payment as Collected or Pending after completing the job
- Enter amount collected and payment method (cash, bank transfer, etc.)
- Pending-payment jobs highlighted on the owner dashboard
- Full payment history stored per job
- Owner dashboard shows total outstanding balance across all open jobs
- Payment data is brand-tagged — owner can see revenue by brand

Category B — Revisit and scheduling (Modules 07 – 08)

07 Revisit scheduling and tracking Operations

When a technician flags a complaint as unresolved, a revisit record is automatically created and scheduled.

- On marking 'Needs Revisit', technician must select a reason: part unavailable, customer not home, issue recurring, further diagnosis required, or custom note
- Office staff or owner sets the revisit date and time slot
- Technician receives a separate notification for the revisit with full complaint details
- Technician logs actual arrival time — punctuality tracked independently for each revisit
- Outcome recorded at end of revisit: Resolved or Needs Another Revisit
- All revisit records appear as a numbered timeline inside the parent complaint (Revisit 1, Revisit 2, etc.)
- A different technician can be assigned to a revisit if required

08 Punctuality tracking Operations

Every scheduled visit — first visit, revisit, or installation — is tracked for on-time arrival. The system calculates punctuality automatically.

- Office sets a scheduled time slot or exact time for each visit
- Technician logs actual arrival time when marking 'In Process' at the customer site
- System compares scheduled vs actual arrival and labels the visit: On Time, Late, or No-Show
- Configurable grace period before a visit is flagged as late (default: 15 minutes)
- Lateness duration recorded in minutes per visit
- No-show logged automatically if no arrival is recorded before end of scheduled slot
- Punctuality data feeds into both technician analytics and business-wide reporting

Category C — Owner portal and alerts (Modules 09 – 11)

09 Owner full read-write access Management

The owner has the highest level of access and can act on any record at any stage.

- Log new installations and complaints, assign and reassign technicians, edit any record
- Override job status, close jobs manually, or reopen closed ones
- Mark payment collected on any job
- Add or deactivate technician and staff accounts
- Configure alert thresholds (repeat complaint window, punctuality grace period)
- Manage the brand list: add, rename, or deactivate brands
- Export any data table or report to CSV
- All owner actions recorded in a system-wide activity log for accountability

10 Owner dashboard Management

A single-screen command centre giving the owner a live view of all installations, complaints, and technician activity.

- Summary counts: installations today, complaints today, total open jobs
- Open vs completed vs pending-payment jobs at a glance — for both job types
- Per-technician breakdown: installations assigned, complaints assigned, in progress, completed
- Alerts for unacknowledged jobs, overdue visits, and uncollected payments
- Filterable jobs table: sort by date, type (install/complaint), technician, brand, status, or payment
- Click into any job to view its full timeline including all revisit records
- Brand filter available on the dashboard — view all metrics for a specific brand in one click

11 Repeat complaint alert system Alerts

The system automatically detects when a previously resolved customer returns with a new complaint within a configurable time window.

- Configurable repeat threshold (default: 30 days) — adjustable in settings
- Owner receives an in-app alert the moment a repeat complaint is logged
- Alert links directly to the new complaint and shows full prior complaint history for that customer
- Repeat complaints tagged with a 'Repeat' badge in the complaints table
- Customers with 3+ complaints in any 90-day window flagged as 'frequent complaint' customers
- Owner can investigate whether the original issue was properly resolved or the technician's work needs review

Example of how the repeat complaint alert appears on the owner's dashboard:

Repeat complaint detected

Ahmed Raza (0300-1234567) raised a new complaint. Previous complaint #C-041 was resolved 18 days ago.
Threshold: 30 days • View complaint history • Assign technician

REPEAT — 18 days

Figure 9 — Repeat complaint alert banner on owner dashboard

Category D — Staff portals (Modules 12 – 13)

12 Office staff portal Operations

A focused workspace for the office person to manage intake of both installations and complaints, and dispatch technicians.

- Quick-entry form to log a new installation or complaint in under 60 seconds
- Job type selector at the top: Installation or Complaint — form adapts accordingly
- Customer lookup: search existing customers to pre-fill details for repeat jobs
- View all open installations and complaints in a unified sortable list
- Reassign or add notes to any job
- See technician workload at a glance before assigning
- Schedule and manage revisit time slots for complaints

13 Technician mobile view Operations

A mobile-optimised interface for field use — simple, fast, and designed for basic smartphones. Covers both installations and complaints.

- My Jobs list showing all assigned installations and complaints, sorted by schedule
- Job type badge on each card: Installation (green) or Complaint (blue) — clear at a glance
- Full job detail view: customer name, address, brand, unit type, issue notes, and prior history
- Acknowledge, update status, log arrival, and mark payment — all in a few taps
- Add field notes or flag issues from any job screen
- Separate notifications for first-visit, revisit, and installation assignments
- Optimised for low-end Android devices and basic browsers

Category E — Brand management (Module 14)

14 Brand / company segregation Brand

Every installation and complaint is tagged with an AC brand. The owner can filter any view, report, or analytics chart by brand to see performance across their official service partnerships.

- Brand field is mandatory when logging any installation or complaint — selected from a pre-configured dropdown
- Owner manages the brand list in settings: add, rename, or deactivate brands (e.g. Dawlance, Haier, Gree, PEL, Orient, Kenwood, and any others)
- Brand filter available globally — applies to the dashboard, complaints list, installations list, and all analytics
- Per-brand metrics: installations completed, complaints received, complaints resolved, revenue collected, and revisit rate
- Technician performance reports can be filtered by brand to see how a technician performs for a specific brand's products
- Useful for official service partnership reporting — generate a summary for a specific brand at any time
- Brands can be colour-coded in the interface for quick visual identification

Example of how brand segregation appears across the dashboard metrics:

Figure 10 — Brand filter applied to dashboard metrics

4. Analytics

The analytics suite is split into two tiers: technician-level performance and business-wide health. All analytics are owner-only, filterable by date range and by brand, and exportable to CSV.

4.1 Technician performance analytics (Module 15)

A per-technician scorecard covering both installation and complaint jobs — speed, quality, punctuality, revenue, and optional customer rating.

Figure 11 — Key technician performance metrics (last tile is optional)

Metric	Applies to	Description
Average resolution time	Complaints	Time from complaint logged to resolved per technician.
Complaints resolved	Complaints	Total complaints fully closed, filterable by period and brand.
Installations completed	Installations	Total installation jobs completed by this technician.
Payment collected	Both	Total revenue collected across all job types.
Pending payment amount	Both	Outstanding balance on jobs assigned to this technician.
First-visit resolution rate	Complaints	% of complaints resolved without requiring a revisit.
Revisit rate	Complaints	% of complaints that needed at least one revisit.
Repeat complaint rate	Complaints	% of resolved complaints that returned within 30 days.
Acknowledgment response time	Both	Avg. time between assignment notification and acknowledgment.
On-time arrival rate	Both	% of all scheduled visits arrived within grace period.
Average lateness	Both	Avg. delay in minutes on late visits.
No-show count	Both	Scheduled visits with no recorded arrival, by period.
Month-on-month trend	Both	Job count and performance this month vs last month.
Avg. customer rating ★ OPTIONAL	Both	Average star rating received from customer reviews.

4.2 Business-wide analytics dashboard (Module 16)

A high-level view of the full operation covering both installations and complaints, with brand-level filtering across every metric.

Figure 12 — Key business-wide metrics (rightmost tile shows brand breakdown)

Metric	Applies to	Description
Revenue by month	Both	Total payment collected month-on-month across all job types.
Job volume by month	Both	Installations + complaints received vs completed each month.
Total jobs completed	Both	Cumulative count for any date range, filterable by job type.
Pending payment total	Both	Total uncollected revenue across all open jobs.
Average resolution time	Complaints	Business-wide average complaint-to-resolution time.
Average install completion time	Installations	Business-wide average booking-to-completion time.
First-visit resolution rate	Complaints	% of complaints resolved on first visit, business-wide.
Repeat complaint rate	Complaints	% of resolved complaints returning within 30 days.
Revisit breakdown	Complaints	Split: first-visit / one revisit / two or more revisits.
Most common revisit reasons	Complaints	Ranked list of reasons for failed visits.
Business-wide on-time rate	Both	% of all scheduled visits on time, trended by month.
Technician leaderboard	Both	Ranked by jobs completed, revenue, and first-visit rate.
By brand: installs completed	Installations	Count of installations completed per brand.
By brand: complaints resolved	Complaints	Count of complaints resolved per brand.
By brand: revenue	Both	Total revenue collected per brand.
By brand: revisit rate	Complaints	% of complaints per brand needing a revisit.
Frequent complaint customers	Complaints	Customers with 3+ complaints in any 90-day window.

Busiest days and hours	Both	When do most jobs arrive? Helps with staffing.
------------------------	------	--

Optional add-on (Module 17)

The following module is an optional addition that can be included or excluded based on client preference. It does not affect any of the core 16 modules.

17 Customer reviews and ratings Optional ★OPTIONAL

After a complaint is resolved or an installation is completed, the technician can hand their device to the customer for a quick star rating and optional written comment.

- Triggered automatically at the end of any completed job (complaint resolved or installation completed)
- Technician taps 'Request Review' and hands device to customer
- Customer selects a star rating (1 to 5) and can add an optional written comment
- Technician can tap 'Skip' if the customer is unavailable or unwilling
- Reviews are tied to the specific job, technician, and brand
- Owner can view all reviews in a dedicated section — filterable by technician, brand, and date
- Average star rating per technician added to the technician analytics scorecard
- Average rating per brand visible in the brand breakdown view
- Low-rated jobs (e.g. 1 or 2 stars) flagged on the owner dashboard for follow-up

OPTIONAL ADD-ON

Customer Review

After resolving a complaint or completing an installation, the technician can hand their device to the customer for a star rating and optional written comment.
